

Service Hangers

Cap Ends for Screwed Rod & Channel

There are hazards associated with unprotected screwed rod ends and channel within ceiling voids during and after services have been installed. Extended lengths of screwed rod are often left on brackets. Burred edges after cutting the rod or channel can sometimes be felt.

A quick and easy solution whilst fixing the brackets is to fit cap ends to provide protection as shown in the photographs below.

- Cost effective.
- Easy to fit, whilst hanging brackets.
- Easy to retrofit to existing installations.
- Reduces risk of injury during construction works and maintenance.
