

Temporary Cable Management

Trailing electrical leads are a problem on many construction sites. A typical solution is to use cable ties but not all trades carry these with them. If a solution is easily available to the workers then you are more likely to see them solve this problem themselves. These plastic hooks are a simple, inexpensive solution

Key Points:-

1. Does not conduct electricity.
2. Allows cables to be moved easily if they are in the way of a work face.
3. Cable ties offer a more secure solution but these are not carried by all workers.
4. Makes it easy for anybody to correct a trailing lead when they spot it if the cable hooks are available.
5. The hooks can slide along the support leaving extended loops of cable.
