

Cutting Stations

Undertaking refurbishment within a live occupied building presents many challenges, one of those being noise. The sound generated from cutting operations can reverberate through a building, making it hard for client occupied staff to concentrate on conference or phone calls. In addition the dust created can be an unwelcome hazard. This is where a cutting station with its sound deadening foam pads reduces the noise to a more reasonable level, allowing most cutting operations to now be carried out during normal office working hours.

Typical Cutting Station Example

Dust Collection System

Key Points:-

1. Easily Manoeuvrable due to the four braked wheels.
2. Fire rated sound deadening foam.
3. Extendable trestle supports for longer material lengths.
4. Built in lighting and 110v power supply.
5. Built in dust collection unit.
6. Allows cutting operation to be performed at bench height.
7. Overall Noise & Dust reduction, with all debris in one place.
